Jakub Koláček

Senior Java Backend Developer · Brno, Czech Republic
+420 705 989 071 | jakub@kolacek.dev | kolacek.dev | github.com/Jakolcz | LinkedIn

Profile:

Senior Java backend developer with 13+ years of commercial experience in banking, telecom, travel, energy and the public sector. I design and build event-driven microservices (Spring Boot, Kafka), integrate systems and develop identity-management connectors — from the API contract through to Kubernetes deployment. Independent since 2025; open to B2B contracts and senior or lead roles.

Professional Experience:

06/2025 – Present

Freelance (self-employed) – Senior Java Backend Developer

B2B backend development for clients, alongside my own products.

Projects:

- **Global travel company** (contract continuing a 2022 engagement) – further development of a platform of ~45 event-driven microservices (supplier messaging, automatic guide assignment, document sharing, reporting). Leading the migration to Spring Boot 4 and Java 25: upgrade guides, custom OpenRewrite recipes, a shared parent POM and service archetypes; about half of the services are migrated so far.
- **Own products (in development)** – a multi-tenant SaaS for gatehouse and security-guard operations (backend and Kubernetes infrastructure), and an AI tool for analysing construction and public-procurement budgets (reactive Quarkus API, Python pipeline with semantic search).

Technologies: Java 25, Spring Boot 4, Quarkus, Kafka & Kafka Streams, Avro, OpenSearch, gRPC, PostgreSQL (R2DBC), Auth0, Kubernetes, Helm, ArgoCD, Jenkins, GitLab CI, OpenRewrite, Python

06/2015 – 05/2025

IBA CZ, s.r.o. – Senior Java Developer

Application development for enterprise clients.

Projects:

- **Global travel company (2022–2025)** – partner and supplier portal platform on event-driven microservices: Kafka Streams processors, REST and gRPC APIs, OpenSearch (formerly Elasticsearch) data for portals and reports. Started several new services (messaging, reporting, history, deep links, NPS), created the shared libraries, maintained the service archetypes; Auth0 configuration as code.
- **Identity management (midPoint IDM)** – REST and SOAP connectors between midPoint and third-party systems for banks (including a central bank), a building society and a state road agency, e.g. SAP SuccessFactors, Microsoft Graph (Azure AD), Kafka, Jira, Helios Green and FOXIM API; IAM with Keycloak / Red Hat SSO on OpenShift; an in-house framework for building REST connectors.
- **Payment gateway for a major telecom operator** – implementation and customisation, payments via Barion, recurring payments, an EET (electronic sales records) library and an export module synchronised with SAP; automated GUI tests (Gauge), deployment automation and test runs in Jenkins.
- **M2M adapter** for communication between payment terminals and prepaid SIM top-up services.
- **DeCM document management system** (IBA product) – workflow and approval processes (Activiti), LDAP/AD synchronisation, asynchronous jobs, MongoDB, Elasticsearch; Java EE on WildFly.
- **Trusted archive** – electronic signatures and time stamps for submitted documents according to XAdES and PAdES.
- **Vending-machine management for a tobacco distributor** – server communicating with the machines and planning deliveries, plus an Android app guiding drivers through each round.
- **Data-box importer for an energy group** – periodically imports the public list of Czech government data boxes and offers a REST API to search and verify them.
- **Other projects** – technological innovation of cash-flow management between branches and deposits for a retail bank; development and support of a customer

Jakub Koláček

+420 705 989 071 | jakub@kolacek.dev | kolacek.dev | github.com/Jakolcz | LinkedIn

portal for a Slovak telecom operator; maintenance of a legislative helpdesk used by a central government office.

Technologies: Java 8–21, Spring (Boot, Security, Data, WebFlux), Hibernate, Liquibase, Kafka, Elasticsearch, MongoDB, Activiti, midPoint / ConnId, Keycloak, Docker, Kubernetes, Jenkins, Gauge, Android, PostgreSQL, Oracle DB, WildFly, Liferay

06/2013 – 05/2015 **Hartmann Rico** – Java Developer, IT department

Components (forms, requests) streamlining internal workflows, connected to databases and SAP.

Examples:

- Electronic leave and home-office requests, an annual appraisal form, and a qualifications overview with automatic sign-in to e-learning.
- Automatic PDF generation (wkhtmltopdf) and storage in EMC Documentum – a standalone Java SE application outside CQ5.
- Integration of Adobe CQ5 with SAP via SAP JCo – calling and processing BAPI functions.

Technologies: Adobe AEM/CQ5, Java SE/EE, Maven, Apache OpenCMIS, JDBC, SAP JCo, JavaScript, jQuery, MSSQL, MySQL, Git

11/2012 – 04/2013 **ANeT s.r.o.** – Android Developer

Android chip-card reader (entry terminal) storing passages locally and syncing them to the company database via a web service.

Technologies: Java SE, Android SDK, web services

2011 – 2012 **Earlier experience**

- Hartmann Rico (part-time while studying) – EDI e-invoices and delivery notes in BIS Seeburger; websites thermoval.cz and thermoval.sk in CQ5.
- memecomics.cz – programmer; Gigacomputer – technician.

Education:

2009 – 2013 **Secondary Technical School of Electrical Engineering and IT, Brno**

Information Technology – PC applications, information and database systems.

Skills:

Languages	Czech – native; English – B2
Backend	Java, Spring Boot / Spring Cloud / WebFlux, Quarkus, Hibernate / JPA, REST, OpenAPI, gRPC
Messaging & data	Kafka & Kafka Streams, Avro / Schema Registry, PostgreSQL, Oracle, OpenSearch / Elasticsearch, MongoDB, Hazelcast
DevOps & cloud	Docker, Kubernetes, Helm, Istio, ArgoCD, Jenkins, GitLab CI, AWS, Cloudflare
Identity & security	midPoint / ConnId, Keycloak, Auth0, OAuth2 / JWT, XAdES / PAdES
Other	Python, TypeScript, Android, test automation (JUnit, Karate, Gauge), OpenRewrite

Own Projects:

- **ff-lite** – feature-flag library for the JVM: targeting rules, percentage rollouts, JDBC and Redis stores, Spring Boot starter and Quarkus extension.
- **CCTV video analysis** – Java app reading camera streams via OpenCV, detecting objects and licence plates with YOLO; my own trained weights replaced the unmaintained OpenALPR with YOLO + Tesseract.
- **Also** – qvak.cz (edge-hosted soundboard: Astro, Quarkus on Java 25, Cloudflare R2), Monetize4Dev (paid Maven repository on Cloudflare Workers), a Python AI video pipeline, Chrome extensions.
